# Summary

---

- 1 Exercise 1: Advanced OAR features: container, array jobs
- 2 Exercise 2: Best effort jobs
- 3 Exercise 3: Checkpoint restart

# Introduction

## Objectives

- Discover the advanced features of OAR
- Show how it can improve your workflows
- Use the advanced launcher scripts

**Follow the tutorial on readthedocs:**

- <http://bit.ly/1Gwq3BL>

## Summary

- 1 **Exercise 1: Advanced OAR features: container, array jobs**
- 2 Exercise 2: Best effort jobs
- 3 Exercise 3: Checkpoint restart

## Container jobs

- special job type
- a container is a pool of resources
- you can submit subjobs in a container

```
(frontend)$> oarsub -t container -l nodes=2 "sleep 1800"  
(frontend)$> oarsub -I -t inner=<container id>
```

## Array jobs

- submit N jobs in one oarsub command
- split your workload according to the index
- other possibility: "-array-param-file"

```
(frontend)$> oarsub -array <N> -l /core=1  
/path/to/prog.sh
```

## Summary

- 1 Exercise 1: Advanced OAR features: container, array jobs
- 2 Exercise 2: Best effort jobs**
- 3 Exercise 3: Checkpoint restart

# Best effort

- low priority
- overcome the limits (50 jobs in the default queue, 1000 in the besteffort queue)
- can be killed if the resources are required by the default queue
- killed jobs can be resubmitted automatically (idempotent)
- use a short walltime and resubmit the jobs until completion

```
(frontend)$> oarsub -t besteffort /path/to/prog
```

```
(frontend)$> oarsub -t besteffort -t idempotent  
/path/to/prog
```

## Summary

- 1 Exercise 1: Advanced OAR features: container, array jobs
- 2 Exercise 2: Best effort jobs
- 3 Exercise 3: Checkpoint restart**

# Checkpointing

- save the state of an application
- be able to restart it from the saved state
- overcome the limits (walltime)
- bonus: fault tolerance
- case by base custom implementation, or generic with BLCR

```
(frontend)$> oarsub -checkpoint 30 -signal 12 -l  
walltime=00:02:00 -t besteffort -t idempotent  
/path/to/prog
```

Thank you for your attention...
